	TENSILE MODULUS	TENSILE STRENGTH	ELONGATION AT BREAK	MELTING POINT	YIELD STRENGTH	CHARPY IMPACT NOTCHED	HARDNESS	DENSITY	COMPOSITION
	Is the mechanical stress that would generate a theoretical elongation of 100% of the initial length of a material. The higher this value, the more rigid the material is	Is the stress from which a material deforms irreversibly. This value characterizes the resistance of a material	Is the ability of a material to elongate plastically before breaking during a tensile test. The higher this value, the more ductile the material is	Is the temperature at which a crystalline material changes from a solid state to a liquid state	The yield point indicates the limit of elastic behavior and the beginning of plastic behavior. The yield strength is the stress corresponding to the yield point at which the material begins to deform plastically	Is the energy required to break a previously notched test tube (sample of material). This value measures the impact resistance of a material	Is a value scale for characterizing the hardness of a material	Is the relationship between the mass of the substance and how much space it takes up (volume).	Is the composition of the metal alloy
